

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

HERBARIUM TO BE DISPOSED OF.—I learn to my surprise that the Herbarium of the late J. T. Holton, which was carefully boxed up in his lifetime, still remains on the hands of his widow and children. It was long ago understood that his college classmates were to purchase it for four or five hundred dollars, and present it to their alma mater, Amherst College. This has not been done, and the collection could now be had by any botanist at a low price. The herbarium is mainly North American, but contains the full set of the collection which Mr. Holton made in the interior of New Grenada, a great number of *Ericææ* collected and named by Drege at the Cape of Good Hope, etc. The number of species, according to Mr. Holton's memorandum, is 6,895. Address Mrs. S. W. Holton, Everett, Mass.—A. GRAY.

(Mr. Holton also left in his library fourteen consecutive volumes of DeCandolle's *Prodromus*, which his widow would be glad to sell.—ED.)

DIGESTION IN PLANTS.—Dr. Lawson Tait has recently investigated afresh the Digestive Principles of plants. While he has obtained complete proof of a digestive process in *Cephalotus*, *Nepenthes*, *Dionæa*, and the *Droseraceæ*, he entirely failed with *Sarracenia* and *Darlingtonia*. The fluid separated from *Drosera binata* he found to contain two substances, to which he gives the names "droserin" and "azerin." Dr. Tait confirms Sir J. D. Hooker's statement that the fluid removed from the living pitcher of *Nepenthes* into a glass vessel does not digest. A series of experiments led him to the conclusion that the acid must resemble lactic acid, at least in its properties. The glands in the pitchers of *Nepenthes* he states to be quite analogous to the peptic follicles of the human stomach; and when the process of digestion is conducted with albumen, the products are exactly the same as when pepsine is engaged. The results give the same reactions with reagents, especially the characteristic violet with oxide of copper and potash, and there can be no doubt that they are peptones.—NATURE.

FLORIDIAN ALGÆ.—During my recent cruise among the Florida Keys nothing interested me so much as the Sea-weeds. Being familiar with the Algae of the Pacific and Atlantic coasts, I would hardly have believed that many of these belonged to that order, but for some previous acquaintance. Their resemblance to lichens, fungi, and corals is truly wonderful. Knowing the Reef Algae to be much sought for and almost unobtainable, I collected a large quantity of specimens and had excellent success in preserving them. They have been identified by Prof. Farlow, our best authority on Marine Algae, and in December I shall have them ready for distribution, mounted in the best manner on card board $4\frac{1}{2}$ by $6\frac{1}{2}$ inches in size. They will be issued in three sets, each comprising two dozen species, at three dollars per set.—A. H. CURTISS.
